Airborne Geophysics completed over the entire favorable belt (see VTEM flight lines)

Other targets similar to Pickett Mt. identified
Drilling in 2020

Focused on discovery of new deposits nearby and the 30km belt

Deposit Geology and New Drill Targets

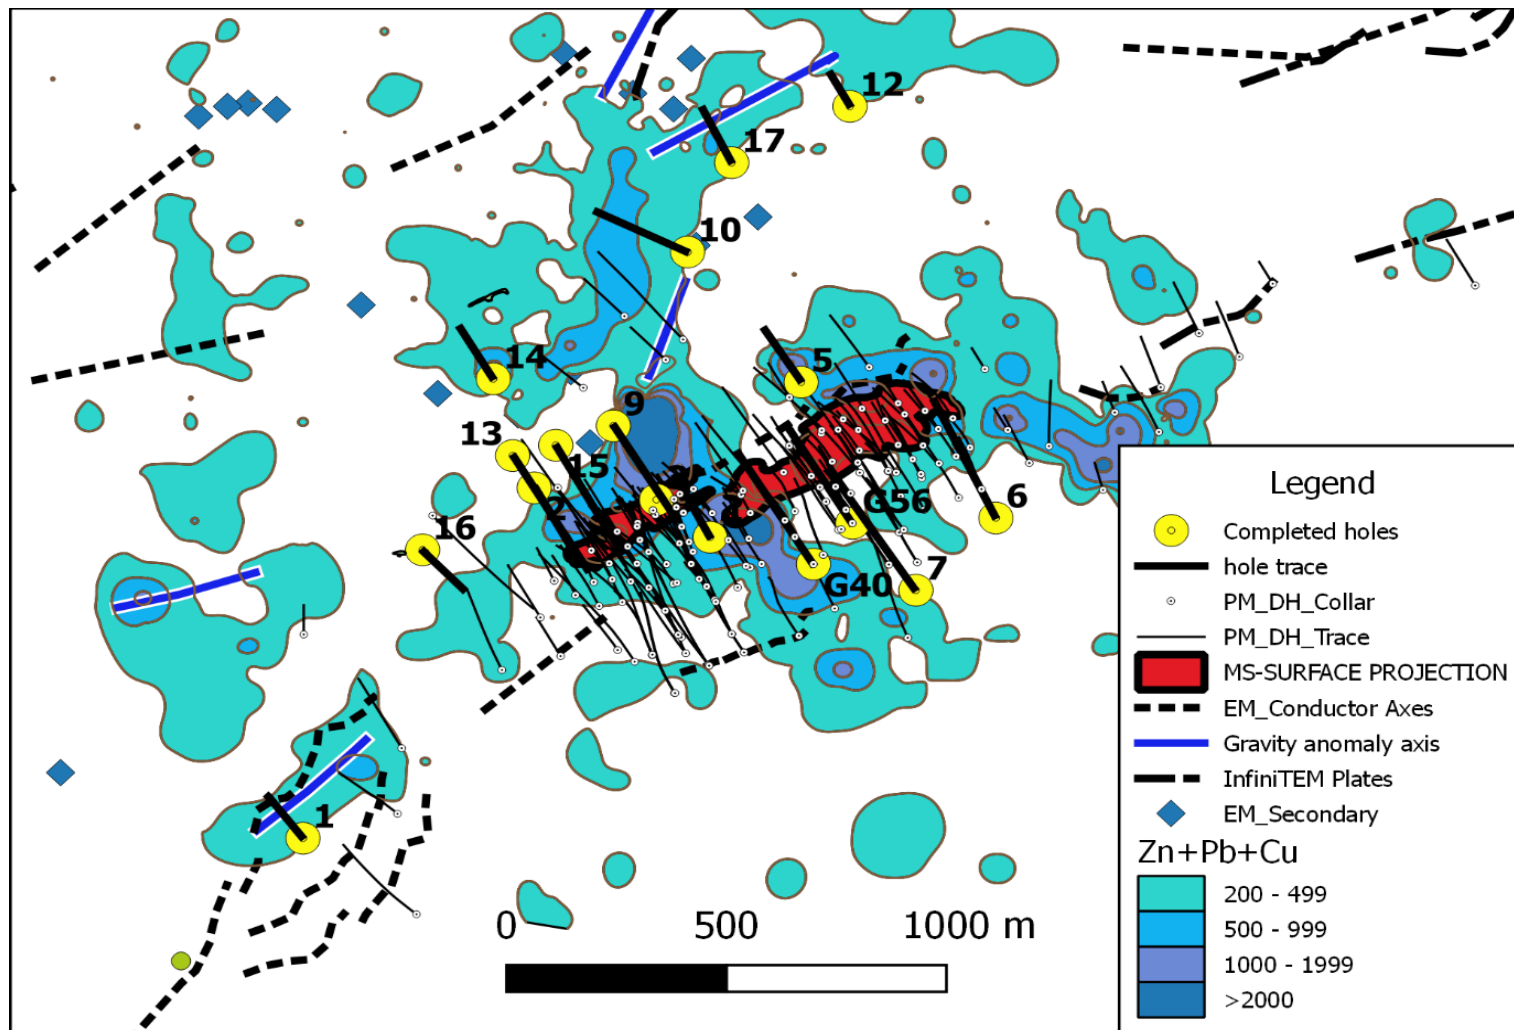

- All information to date suggests the presence of 3 mineralized horizons (Main Zone, Footwall & Northern)
- Hole PX-001 may occur on the Northern horizon as evidenced by TDEM anomalies B & C, located to the east

WOLFDEN

Near Vertical Geometry Positive for Mining

VMS deposits usually form in small, discreet high-grade clusters

Often exhibit “stacked” lenses and pods due to folding or structure

Potential in footwall for lens

Downhole geophysics and rock alteration useful in targeting new lenses to be drill tested

- +200 metres of stringer mineralization with quartz-pyrite-sphalerite-galena-chalcopyrite
- Stringer zone may be part of stratigraphy or a sub-volcanic intrusion crosscutting stratigraphy
- Hole stopped short of target with rods stuck in the hole
- Whole rock analysis indicates similarities to Main Zone felsic footwall stringer zone
